Washington, DC 20460

**Re: Comments on the United States Environmental Protection Agency's *Interim Framework for Advancing Consideration of Cumulative Impacts*
Docket ID No. EPA-HQ-OLEM-2024-0360**

The Attorneys General of Massachusetts, Illinois, Maryland, Minnesota, Oregon, New Jersey, and Vermont (States) submit these comments in support of the United States Environmental Protection Agency's (EPA) *Interim Framework for Advancing Consideration of Cumulative Impacts*, 89 FR 92125 (November 21, 2024).

Our States share EPA's commitment, stated in the *Interim Framework for Advancing Consideration of Cumulative Impacts* (the *Framework*),¹ to "address the problem of cumulative impacts that federal advisory councils, EPA Tribal Partnership Groups, and communities have brought to its attention for decades."¹ As EPA acknowledged with the release of the *Framework* in December 2024, deliberate efforts are needed to address adverse cumulative impacts and "improve protection of human health."² We appreciate EPA's leadership as demonstrated by the release of the *Framework* and welcome the opportunity to comment. Establishing common goals and principles and providing clear models for implementing cumulative impacts analysis will result in

¹ EPA, INTERIM FRAMEWORK FOR ADVANCING CONSIDERATION OF CUMULATIVE IMPACTS 9 (Nov. 2024) [hereinafter INTERIM FRAMEWORK] (citing EPA, PAPER ON TRIBAL ISSUES RELATED TO TRIBAL TRADITIONAL LIFEWAYS, RISK ASSESSMENT, AND HEALTH AND WELL BEING: DOCUMENTING WHAT WE'VE HEARD (2006), <https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1006LIF.txt>; EPA, THEMATIC SUMMARY: CUMULATIVE IMPACTS RESEARCH INPUT LISTENING SESSIONS WITH TRIBES AND STATE AND LOCAL AGENCIES (2021), https://cfpub.epa.gov/si/si_public_record_Report.cfm?dirEntryId=354029&Lab=OSAPE; Nat'l Env't Just. Advisory Council (NEJAC), ENSURING RISK REDUCTION IN COMMUNITIES WITH MULTIPLE STRESSORS: ENVIRONMENTAL JUSTICE AND CUMULATIVE RISKS/IMPACTS, EPA (2004), <https://www.epa.gov/sites/default/files/2015-02/documents/nejac-cum-risk-rpt-122104.pdf>; NEJAC, RECOMMENDATIONS FOR INTEGRATING ENVIRONMENTAL JUSTICE INTO THE EPA'S RESEARCH ENTERPRISE, EPA (2014), <https://www.epa.gov/environmentaljustice/recommendations-integrating-environmental-justice-epas-research-enterprise>; WHITE HOUSE ENV'T JUST. ADVISORY COUNCIL, FINAL RECOMMENDATIONS: JUSTICE40, CLIMATE AND ECONOMIC JUSTICE SCREENING TOOL, AND EXECUTIVE ORDER 12898 REVISIONS (2021), <https://www.epa.gov/sites/default/files/2021-05/documents/whiteh2.pdf>).

² INTERIM FRAMEWORK, *supra* note 1, at 6.

more effective, transparent, and consistent implementation across EPA and the federal government. Moreover, it will encourage stronger collaboration with State, local, and Tribal governments; communities; and regulated entities, and support more robust State, local, and Tribal policymaking.

The undersigned States remain steadfast in the commitment to comprehensive evaluation of and response to health, environmental, and socioeconomic burdens faced by communities in our jurisdictions and nationwide. We therefore urge EPA to keep the *Framework* in place to promote consistency, accuracy, fairness, and transparency in environmental decision-making. We further urge ongoing federal action to strengthen cumulative impacts analysis and further the goal of health, safety, and prosperity for all.

I. States Have a Strong and Vested Interest in Advancing Cumulative Impacts Analysis in Environmental Decision-making.

Cumulative impacts analysis fills a critical gap in understanding population vulnerability and assisting decision-makers to mitigate and prevent disproportionate environmental and climate harms, by identifying and measuring “all chemical and non-chemical ‘stressors’ that affect a community’s health, well-being, and quality of life.”³ Understanding cumulative impacts provides insight into critical social determinants of health that affect individual and community responses to stressors. Cumulative impacts analysis also captures challenges to climate adaption that are inextricably linked to both past and present land use decisions and patterns and their underlying inequities. And the cumulative impacts analysis process makes visible people and places who could most benefit from investments in health, environment, and infrastructure—including to correct for ongoing disinvestment and prepare for and recover from escalating environmental and climate disasters.

Our States are committed to continued innovation as we integrate cumulative impacts analysis into environmental, climate, and public health policy. To date, twenty-two states have developed or are currently advancing approaches for incorporating cumulative impacts analysis into decision-making.⁴ Our States have been on the leading edge of these efforts, through the development of mapping and screening tools; advancement of legislation, regulations, and policies; and robust engagement of stakeholders—in both the policy development and implementation stages. We will continue to invest in these processes to restore and protect a healthy environment—wherever people live, play, work, learn, grow, and worship. The costs of inaction to our States and our residents are too high.

³ UNION OF CONCERNED SCIENTISTS & COMING CLEAN, THE COMMUNITY GUIDE TO CUMULATIVE IMPACTS 5 (Oct. 2024), https://www.ucsusa.org/sites/default/files/2024-10/Cumulative%20Impacts%20Guide_Eng.pdf.

But federal action and guidance on cumulative impacts also remains vital to inform our efforts to implement and enforce federal environmental statutes. Consistency across EPA and all federal agencies is necessary as we, alongside local and Tribal governments, businesses, and communities collaborate with EPA and other federal agencies on projects that trigger environmental review. Federal leadership, including clarity on terms, methodology, and implementation, assists us, as well, in developing our own State- and context-specific approaches to understanding and addressing cumulative impacts in our communities.

Our States are each at different stages of designing, adopting, and implementing our respective cumulative impacts approaches. Some of our States are considering pending legislation. Others are working through public processes to identify indicators, datasets, criteria, and key terms, in anticipation of rulemaking. Still others are implementing existing cumulative impacts approaches to mapping and screening, siting and permitting, and the distribution of resources, informed by community and stakeholder engagement. As we each advance our respective approaches, we can learn from one another, and we look to EPA to serve as a centralized hub to support continued innovation at the state and local level. Thus, we support the release of the *Framework* and urge its implementation and continued efforts to move the needle to support healthy, resilient, and thriving communities.

II. Understanding Cumulative Impacts is Crucial to Ensuring a Healthy Environment for All.

The 2023 Cumulative Impacts Research Recommendations report issued by EPA’s Office of Research and Development defines cumulative impacts as “the totality of exposures to combinations of chemical and non-chemical stressors and their effects on health, well-being, and quality of life outcomes.”⁵ The report further clarifies that

“[c]umulative impacts include contemporary exposures to multiple stressors as well as exposures throughout a person’s lifetime. They are influenced by the distribution of stressors and encompass both direct and indirect effects to people through impacts on resources and the environment. Cumulative impacts can be considered in the context of individuals, geographically defined communities, or definable population groups.

⁵ EPA, CUMULATIVE IMPACTS RESEARCH: RECOMMENDATIONS FOR EPA’S OFFICE OF RESEARCH AND DEVELOPMENT, EPA/600/R-2214a vii (Sep. 30, 2022), <https://www.epa.gov/system/files/documents/2023-05/CUMULATIVE%20IMPACTS%20RESEARCH-FINAL%20REPORT-EPA%20600-R-22-014A%20%2812%29.PDF>. [hereinafter CUMULATIVE IMPACTS RESEARCH].

Cumulative impacts characterize the potential state of vulnerability or resilience of a community.”⁶⁷

People experience the cumulative impacts of environmental and climate stressors every day, from home to work to school.⁸ Individuals bear an “allostatic load” or the “cumulative biological risk due to wear and tear on the human body from multiple and repeated stresses over time.”⁹ Cumulative biological impacts originating from “being chronically exposed to, and having to cope with, socially structured stressors” is called “weathering.”¹⁰

Vulnerability to such stressors increases “due to intrinsic factors, such as age, existing health or genetic conditions, or extrinsic factors, such as socioeconomic vulnerability and structural drivers of inequality[,]”¹¹ among the many social and political determinants of health.¹² Geographically- based communities, notably communities of color; Indigenous Peoples and Tribal Nations; low-income, rural, and unincorporated communities; and communities with low educational attainment,¹³ “may be both positively and negatively influenced by common forces.”¹⁴ These can include environmental, infrastructural, economic, public health, and climate burdens, as well as a lack of corresponding benefits, “clustered spatially in recurrent, persistent, and systematic

A. Discriminatory Policies Have Led to Environmental Disparities.

As many of our States have described in previous comment letters to EPA,^{21,22} the environmental health disparities referenced above are rooted in interlocking systems of oppression that created, maintained, and now perpetuate disparities. These disparities stem from the enslavement of African and Indigenous people across this hemisphere, the coerced indentured labor of Asians and Latino/a/é immigrants, and the forced removal and displacement of Indigenous Peoples and Tribal Nations.²³ More proximately, Chinese Exclusion, Japanese internment camps, Spanish castas, and caste systems, Jim Crow, redlining, and housing covenants, among others, set the stage for the racist views of the early 20th century to become subsumed into policy and land use decisions.²⁴

Today, most Americans live in racially segregated neighborhoods.²⁵ *De jure* and *de facto* segregation guided the development of communities and cemented inequities in place throughout this country. Legally based segregation, whether explicitly through Jim Crow laws and racially restrictive covenants or implicitly through zoning and federal housing policy, helped to ensure Black, Brown, and low-income communities were kept separate from their White or wealthier counterparts. This segregation remains in place today.

See generally RICHARD ROTHSTEIN, THE COLOR OF LAW: A FORGOTTEN HISTORY OF HOW OUR GOVERNMENT SEGREGATED AMERICA (2017); DOUGLAS MASSEY & NANCY DENTON, AMERICAN APARTHEID: SEGREGATION AND THE MAKING OF THE UNDERCLASS (1993).

Zoning laws have been a common source of racial segregation resulting in the disproportionate distribution of environmental burdens and benefits.²⁶ While zoning laws were often justified as protecting public health, safety, and welfare, that protection, in practice, was not felt equally across all communities and was often weaponized to exclude certain communities from specific areas.²⁷ Such weaponization occurred both expressly, such as a 1916 ordinance in Kentucky that prohibited the sale of land to Black persons,²⁸ and by using race-neutral language that had the effect of racial segregation, such as placing restrictions on multi-family housing.²⁹ Racial segregation from zoning laws became further entrenched by the use of restrictions in property deeds that legally prohibited the sale of homes and land to people of color, known as racial covenants.³⁰

In addition to segregating communities, zoning decisions have directly and intentionally perpetuated environmental disparities in many areas of the country by restricting the use of white neighborhoods to single-family homes and small businesses, while allowing polluting industries to proliferate in communities of color.³¹ Furthermore, decisions to permit polluting facilities in communities of color are often made to avoid adverse health and environmental impacts in white neighborhoods as well as protect property values in those neighborhoods.³² Permitting polluting facilities in communities of color may also be less costly for operators and face less opposition due to those communities' lack of political power.³³

Federal housing policies have also contributed to disproportionate distribution of environmental burdens.³⁴ Under the practice of “redlining,” the federally-created Home Owners’ Loan Corporation (HOLC) denied Black people and immigrants access to home ownership by

rating their neighborhoods as too risky to merit granting them mortgage loans.³⁵ Historically redlined neighborhoods today have poorer environmental conditions, including higher levels of pollution and noise, less green spaces, and higher temperatures, than neighborhoods given higher grades.³⁶

Environmental harm from multiple sources assails communities of color as a result of the legacy of discriminatory policies.³⁷ Numerous studies show that hazardous waste sites, industrial facilities, sewage treatment plants, and other pollution sources continue to be sited today in communities of color,³⁸ which also experience greater exposure to pollutants from industry, transportation, and occupational sources.³⁹ Communities of color and low-income communities are also significantly more likely to live near sources of air pollution and breathe fine particulate air pollution.⁴⁰

Environmental disparities experienced by Indigenous Peoples and Tribal Nations are “intimately bound up in the complex matter of tribal sovereignty[.]”⁴¹ Legacies of territorial dispossession, along with laws incentivizing siting of extractive and polluting facilities—“from industry to mining to military bases”—on or near tribal lands, have created heightened exposure to environmental contaminants for Indigenous Peoples and Tribal Nations, presenting a

disproportionate risk of adverse health impacts, including on reproductive health.⁴² Owing to this regulatory environment, in 2023 there were 141 Superfund sites on or within 10 miles of Tribal land,⁴³ the remediation of which has significantly lagged behind that of sites in non-Indigenous communities.⁴⁴ Despite government-to-government consultation requirements, Native communities additionally experience disproportionate barriers to participation in environmental decision-making processes, not only through failures to meet access needs, but pervasively in the form of lack of mutual respect, status inequalities, or skepticism of Indigenous lifeways, science, and knowledge.⁴⁵

B. Exposure to Multiple Intersecting Burdens Results in Disproportionate Harms to Disadvantaged Communities.

The cumulative impact of exposure to multiple sources of pollution has significant health impacts. These impacts include higher rates of a long list of health conditions, including but not limited to hypertension, heart disease, stroke, asthma, obesity, diabetes, and lung cancer.⁴⁶ Rural Black, Native American, and Alaska Native communities are exposed to greater carcinogenic risk and experience worse outcomes from cancer treatment⁴⁷ Native American communities located near extractive industry and Superfund sites experience sharply increased cancer mortality rates due to exposure to heavy metals and chemical waste through unregulated drinking water, contaminated soil, and direct contact.⁴⁸ These risks are exacerbated by barriers to accessing

open green spaces.⁵⁷ And persistent disinvestment impacts access to healthy, affordable, and culturally appropriate food⁵⁸ and health care.⁵⁹

C. Climate Change Exacerbates the Effects of Other Cumulative Environmental Harms.

Climate-related impacts disproportionately affect vulnerable populations facing existing environmental burdens,⁶⁰ functioning as a threat multiplier to exacerbate both environmental risk⁶¹ and economic inequality.⁶² The escalating heatwaves, flooding, sea-level rise, extreme storms, and infectious diseases brought on by climate change have greater impacts on “[r]acially and socioeconomically marginalized communities,” including communities of color, low-income communities, and Indigenous Peoples and Tribal Nations, as well as people with disabilities and unhoused people.⁶³ Across the United States, Native American adults experience the highest mortality rate from natural hazards (such as heat, cold, and storms) among all racial and ethnic groups.⁶⁴ Climate change also threatens the cultural traditions and foodways of Indigenous

communities.⁶⁵ Cumulative impacts analysis provides a particularly important lens through which to understand the compounding harms of the current moment.

For example, decades of disinvestment in historically redlined communities can result in both greater flood risk and fewer federal and local funds allocated for flood protection.⁶⁶ A New York study found that the creation of Significant Maritime and Industrial Areas (SMIAs) in New York City in 1992 resulted in the further concentration of environmental hazards in low-income and communities of color.⁶⁷ All six SMIAs are located within hurricane storm surge zones, increasing flood risks to vulnerable populations due to climate disasters.⁶⁸ These densely populated areas are directly adjacent to heavy industrial facilities and polluting infrastructure⁶⁹ and experience higher incidences of air pollution and the urban heat island effect, exacerbated by climate change.⁷⁰ Following Hurricane Sandy in 2012, community groups in Sunset Park, Red Hook, and Greenpoint expressed heightened concerns about the potential spread of toxic chemicals from Superfund sites via floodwaters.⁷¹ Cumulative impacts analysis was essential to understanding the impacts of Hurricane Sandy and future storm events for these communities.⁷²

Recent scholarship further demonstrates that repeated exposure to climate change-related extreme heat has a cumulative effect, which is greater for low-income communities and communities of color.⁷³ The risk of dying from higher temperatures and extreme heat events was elevated among Black, Latino/a/é, and Indigenous people compared to White people, with even higher risk among non-U.S. citizens, in studies across the United States.⁷⁴ Climate researchers have identified that surface temperatures in formerly redlined communities across the country are

⁷⁴ Berberian, Gonzalez & Cushing, *supra* note 60, at 454.

an average of 2.6 degrees Celsius (4.7 degrees Fahrenheit) warmer than in non-redlined areas due to less tree canopy and more impervious surfaces.⁷⁵

In addition to compounding socioeconomic factors due to residential location, occupational exposures to extreme heat place workers of color, particularly Latino/a/é people—who are overrepresented in industries with high heat-mortality risk such as agriculture and construction—at greater risk of extreme heat exposure.⁷⁶ A recent study in Washington state found that Latino/a/é people were disproportionately impacted by heat-related illness across industries based on workers’ compensation claims from 2006-2017.⁷⁷ Recent studies have also found elevated risk for heat-related illness among Black soldiers in the U.S. and Latino/a/é farmworkers in Florida and Iowa.⁷⁸

In addition to these many burdens, low-income households that experience energy insecurity and lack access to air conditioning during hot weather are at greater risk of heat-related illness or death.⁷⁹ As climate change contributes to hotter summers, the cost of cooling energy will rise and continue to overburden low-income households.⁸⁰ Greater usage rates of air conditioning and cooling units further strain the electric grid and leave marginalized communities more vulnerable to outages and brownouts.⁸¹ These cumulative effects leave low-income and communities of color at the greatest risk of heat-related illness and death.⁸²

D. Compounding Stressors Impose Significant Costs on Affected Communities and States.

Compounding social, environmental, and climate stressors in combination with health vulnerabilities impose significant public health and economic burdens on both communities and State, local, and Tribal governments. Examples include, but are not limited to, costs of health care, damage to infrastructure and natural resources, housing and job instability, and lives lost from environmental pollutants, extreme storms, heatwaves, and wildfires.⁸³

Indoor and outdoor air pollutants are significant contributors to respiratory illness, cancer, and heart disease, resulting in astronomical increases in medical expenses and other costs.⁸⁴ Asthma alone results in “approximately 1.8 million annual emergency department visits in the United States⁸⁵ and accounts for \$50.3 billion in health care costs and \$3 billion in missed school and work days per year.⁸⁶ Asthma is also the most common chronic disease experienced by children and one of the main causes of child hospitalization,⁸⁷ as well as accruing significant costs from physician and outpatient visits and medications.⁸⁸ And environmental pollution also hinders economic stability.⁸⁹ For example, children who grow up in areas with higher levels of traffic-related air pollution and lead in their homes experience lower adult incomes on average relative to their parents.⁹⁰

The health costs related to six climate-related events and disasters in the United States between 2000 and 2009 have been estimated at \$740 million in actual healthcare expenses and over \$14 billion when premature mortality is factored in, a staggering sum even before contemplating other related costs, such as infrastructure damage.⁹¹ The intensification of climate change over time has increased and will continue to increase these financial burdens; climate-related events in 2012 alone are estimated to have cost the country \$10 billion in 2018 dollars.⁹²

Heat-related or heat-adjacent illness in 2023 has been estimated to lead to ~235,000 emergency department visits and 56,000 hospital admissions annually, adding ~\$1 billion in health care expenses.⁹³ Heat exacerbates the impacts of already degraded air quality as “pollutants like ozone and particular matter are difficult to control in high temperatures, resulting in increased costs to meet federal air quality standards and higher health care costs associated with increased rates of

respiratory disease.”⁹⁴ Heat also creates labor productivity declines at approximately \$100 billion annually, and that figure is only rising. Farmworkers are particularly vulnerable and experience underlying cumulative inequities, including higher poverty rates, barriers to health care access, and immigration issues.⁹⁵

The cost of wildfires includes not only immediate damage to property, damage to industry (especially timber), mortality, morbidity, and costs of firefighting; it extends to longer-term impacts on human health from air pollution, business losses due to supply and demand shifts, and displaced recreation and tourism.⁹⁶ Climate-exacerbated wildfires have been estimated to cause economic costs and damages of \$394 to \$893 billion annually, with the majority of costs attributable to real estate value loss, smoke exposure, income loss, and watershed costs.⁹⁷

Overall, the increasing and compounding risks, burdens, and costs associated with the climate crisis speak to the need for using cumulative impacts analysis to fully grasp community needs and develop meaningful solutions.

III. The History and Development of Cumulative Impacts Analysis in the United States

Efforts to understand and mitigate compounding harms to disadvantaged communities and vulnerable populations fueled the development of cumulative impacts analysis.⁹⁸ Gaps in knowledge due to reliance on risk assessment and associated limits in protections from compounding harms provided by environmental regulations demonstrated the need for the more holistic cumulative impacts approach.

⁹⁴ See e.g. Comments of the Attorneys General of Minnesota, Arizona, California, Colorado, Connecticut, the District of Columbia, Delaware, Illinois, Maine, Maryland, Massachusetts, New Jersey, New York, Oregon, Pennsylvania, Vermont, Washington, and Wisconsin, *supra* note 83, at 14.

A. History of Cumulative Impacts Analysis

Enforcement of laws to protect human health and the environment has necessitated tools to identify and measure “substances that cause or pose risks of causing such harms.”⁹⁹ During the 1980s, health, environmental, and safety agencies increasingly adopted risk assessment methodologies to set human health-based standards.¹⁰⁰ Risk assessment involves a range of scientific methods “to define the health effects of exposure of individuals or populations to hazardous materials and situations.”¹⁰¹ Risk assessments “have traditionally focused almost exclusively on single chemicals, specific health endpoints, individual sources or source categories, a particular environmental medium (e.g., air, water, food, soil), and a single exposure pathway and route[.]”¹⁰² Most environmental decision-making now involves some form of risk assessment.¹⁰³

However, even as risk assessment grew in prominence within regulatory regimes, “citizen groups, the National Academy of Sciences, and ultimately the regulatory agencies recognized that some citizens and some groups were not well protected by environmental health laws[.]”¹⁰⁴ including associated methods for measuring risk. As early as 1992, the EPA raised concerns about “a risk-based approach to environmental management” due to “the relative risk borne by low-income and racial minority communities [including] higher than average exposures to selected air pollutants, hazardous waste facilities, contaminated fish, and agricultural pesticides in the workplace.”¹⁰⁵

Members of “[o]verburdened communities first raised concerns about addressing cumulative impacts in order to adequately account for the total burden or ‘lived reality’”¹⁰⁶ faced by residents in their neighborhoods. Specifically, advocates began to bring to light the failure of chemical-by-chemical and source-specific assessments of health risks of environmental hazards to account for and protect from cumulative impacts of multiple environmental and social stressors

⁹⁹ Carl F. Cranor, *Risk Assessment, Susceptible Subpopulations, and Environmental Justice*, in *THE LAW OF ENVIRONMENTAL JUSTICE: THEORIES AND PROCEDURES TO ADDRESS DISPROPORTIONATE RISKS* 341 (Michael B. Gerrard and Sheila F. Roster eds., 2d ed. 2008).

faced by vulnerable communities.¹⁰⁷ Environmental and public health research revealed “a fragmented approach of considering chemicals in isolation an insufficient framework for understanding the interaction of multiple burdens and stressors and informing environmental decision-making—thus, requiring the more comprehensive and holistic consideration provided by cumulative impacts analysis.”¹⁰⁸

B. Community Engagement as Foundational Tenet of Cumulative Impacts Analysis

Community engagement has long been central to cumulative impacts analysis and, in fact, the concept of cumulative impacts analysis itself is product of community-based participatory research conducted to fill the scientific and regulatory gap identified above.¹⁰⁹ Community engagement enables the integration of a community’s unique insight into environmental exposures over time into research on environmental risk, bolstering the credibility of the research and associated policy making efforts.¹¹⁰ Meanwhile, meaningful engagement is essential to ensuring community perspectives shape environmental and public health solutions, including “in planning, advocating for, and implementing the strategies to reduce exposures.”¹¹¹ In essence—addressing cumulative impacts is a process, not just a result.

In New York City, throughout the 1980s and 1990s, community groups like the South Bronx Clean Air Coalition and West Harlem Environmental Action (WE ACT) were both situated in neighborhoods with high hospitalization rates for asthma¹¹² and facing the siting of facilities that would have added to existing burdens. The corporate and municipal representatives in favor

of the noxious facilities—a medical waste incinerator and a new diesel bus depot—argued that there was not adequate proof that emissions would worsen childhood asthma.¹¹³ Community residents argued that the official risk assessments did not consider the cumulative exposure that residents faced from multiple pollution exposures, citing their own experience with asthma as well as the experience of their children.¹¹⁴

Community-based organizations throughout the country have recognized the connections between research, organizing, and advocacy to improve environmental health goals through understanding of cumulative impacts. Community organizations now play a significant role in developing bottom-up strategies to define cumulative impacts and quantify the cumulative pollution burden and vulnerabilities in collaboration with academia and government agencies.

C. Cumulative Impacts in Federal Environmental Decision-Making

As noted in the *Framework*, “[c]umulative impacts analysis may inform a range of federal activities, as appropriate and consistent with federal law.”¹¹⁵ For EPA, this range includes “standard setting, permitting, rulemaking, cleanup, emergency response, funding, planning, state, territorial, and Tribal program oversight, and other decision-making, and initiating administrative or judicial action in situations for which there is actual—or potential for—imminent and substantial endangerment[.]”¹¹⁶

Consideration of the cumulative effects of environmental pollution at the federal level is not new.¹¹⁷ Dating back to 1974, the National Environmental Policy Act (NEPA)¹¹⁸ has required federal agencies to include potentially affected parties in deliberations about projects with significant environmental effects and to consider the cumulative environmental, economic, and public health effects of such projects, including in analyses required for the development of Environmental Impact Statements and Environmental Assessments.¹¹⁹ NEPA defined cumulative effects as “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions[.]”¹²⁰ Such analysis of cumulative effects responded to recognition that “environmental degradation” often results from “multiple changes over time.”¹²¹

¹²⁰ *Id.*

¹²¹ *Id.*

EPA has determined that it has “legal authority to address cumulative impacts in communities with environmental justice concerns” across a broad range of agency activities,¹²² including in the standard-setting context.¹²³ For example, in reviewing and revising performance standards for listed source categories under the Clean Air Act (CAA), EPA may prioritize source categories that contribute to cumulative impacts in communities with environmental justice concerns.¹²⁴ Within eight years of setting national emission standards for hazardous air pollutants, the CAA requires EPA to review the health and environmental risks associated with the emissions standards, and revise them as necessary.¹²⁵ Pursuant to § 112(f)(2), standards for each source category must “provide an ample margin of safety to protect public health[,]” by reducing “lifetime excess cancer risks to the *individual most exposed* to emissions from a source in the category or subcategory[.]” Such a determination requires the consideration contemplated by cumulative risk or impacts analysis by emphasizing determination of the “actual health effects with respect to persons living in the vicinity of sources” including “risks presented by background concentrations of hazardous air pollutants.”¹²⁶ EPA also may consider cumulative impacts when deciding whether to initiate an administrative or judicial action to address actual or potential endangerment.¹²⁷

EPA additionally has authority to employ cumulative impacts analysis when conducting risk assessments, such as under the Toxic Substances Control Act.¹²⁸ As applied to existing chemicals, TSCA requires EPA to eliminate any unreasonable risks presented by “the manufacture, processing, distribution in commerce, use, or disposal of a chemical substance. . . or. . . *any combination of such activities.*”¹²⁹ Implicit in this provision is the requirement to consider cumulative risk, since EPA cannot comply with TSCA’s mandate to eliminate any unreasonable risks caused by a “combination[s]” of uses and other activities unless it first evaluates those combined, or “aggregate,” risks and determines whether they are unreasonable. The consideration of aggregate and cumulative risk is also required by TSCA’s mandate to evaluate and regulate chemicals “in a manner consistent with the best available science.”¹³⁰

EPA also has authority to consider cumulative impacts under the Safe Drinking Water Act, which requires the agency to address imminent and substantial endangerment to the health of persons due to the presence of a contaminant in “a public water system or underground source of

drinking water.”¹³¹ In determining whether a containment poses such endangerment, EPA may consider the contaminant’s cumulative impacts.¹³² EPA’s legal authority to address cumulative impacts in disadvantaged communities also extends to the “permitting, cleanup, emergency response, funding, planning, [and] state program oversight” contexts.¹³³

D. History of EPA’s Cumulative Impacts *Framework*

In 2003, EPA published a *Framework for Cumulative Risk Assessment (2003 Framework)*, “intended to foster consistent approaches . . . within EPA, identify key issues, and define terms[,]” as well as lay groundwork for agency-wide guidelines.¹³⁴ The following year, EPA’s National Environmental Justice Advisory Council (NEJAC) published a report responding to EPA’s request for NEJAC input on implementation of the *2003 Framework*.¹³⁵ In the report, the NEJAC acknowledged EPA’s *2003 Framework* as “a profound advancement in the kind of thinking that will help communities and tribes address their concerns.”¹³⁶ The NEJAC went on to recommend EPA “fully incorporate the concept of vulnerability” and “social, economic, cultural, and community health factors” into EPA’s strategic plans, research agendas, and decision-making.¹³⁷ The NEJAC “promot[ed] a paradigm shift to community-based approaches, particularly community-based participatory research and intervention.”¹³⁸ And finally, the NEJAC urged “a bias for action within EPA through the widespread utilization of an Environmental Justice Collaborative Problem-Solving Model.”¹³⁹

In 2024, EPA, again, requested that the NEJAC provide recommendations “to assist EPA to lay a sound foundation for assessing and addressing cumulative impacts by making overburdened communities, populations or groups, especially those facing extreme exposure or vulnerability, a central part of the process.”¹⁴⁰ In October 2024, the NEJAC issued a report in response, entitled *Recommendations for Reducing Cumulative and Disproportionate Impacts and*

Burdens in Environmental Justice Communities.¹⁴¹ The report includes several recommendations relevant to EPA’s current *Framework*, notably that EPA should:

- “use cumulative impact assessments to reduce disproportionate exposures and impacts in overburdened communities[;]”
- “accelerate the progress of innovative approaches to cumulative impacts implementation[;]”
- “determine and communicate a set of principles to guide the practice of cumulative impact assessment[;]”
- “validate lived experience and incorporate it into assessments and processes through co-design and shared leadership[;]” and
- “incorporate structural drivers such as colonialism and racism into its cumulative impacts practice and framework for implementation [as] root causes and structural drivers of disproportionate and cumulative impacts[.]”¹⁴²

In December 2024, EPA released the *Interim Framework for Advancing Consideration of Cumulative Impacts* to provide EPA’s programs “with a foundation of information and resources that can support developing and implementing approaches to incorporate analysis and consideration of cumulative impacts into their work, with the goal of achieving results that improve health and quality of life in America’s communities.”¹⁴³

IV. Cumulative Impacts Analysis Is Increasingly Important for and Embedded in State Environmental and Public Health Decision-making.

Our States have taken significant steps to integrate cumulative impacts analysis into our environmental and public-health decision-making. In fact, many of our States are at the forefront of efforts to develop mapping and screening tools and advance legislation, regulations, and policies, with community engagement as a core priority.

A. Mapping and Screening Tools

Our States have developed and adopted mapping and screening tools to ascertain the geographic distribution of environmental benefits and harms and social determinants of health.

In 2013, California developed and released a mapping tool, CalEnviroScreen, which became a national model for identifying communities most vulnerable to environmental harms due

¹⁴³ INTERIM FRAMEWORK, *supra* note 1, at 2.

to pollution and health and socioeconomic factors.¹⁴⁴ CalEnviroScreen combines datasets on environmental exposures and effects and socioeconomic factors, which are used to cumulatively rank census tract levels.¹⁴⁵ A number of California programs use that ranking to prioritize resource allocation and environmental protection efforts.¹⁴⁶

More recently in 2022, the New Jersey Department of Environmental Protection (NJDEP) released a beta version of its Environmental Justice Mapping, Assessment, and Protection (EJMAP) tool and companion technical guidance document.¹⁴⁷ EJMAP establishes an objective, publicly available representation of the existing environmental and public health stressors in the state’s overburdened communities and supports the analysis required under the Environmental Justice Rules.¹⁴⁸ Among the several ways EJMAP enables users to identify relevant population, demographic, and environmental data, users can determine whether an overburdened community is subject to adverse cumulative stressors.¹⁴⁹ New Jersey’s EJMAP comes out of requirements under the New Jersey Environmental Justice Law¹⁵⁰ to determine the appropriate geographic point of comparison for the overburdened community comparative analysis. New Jersey compares overburdened communities, or an adjacent block group’s greatest stressed overburdened community neighbor, to both the state and relevant county non-overburdened community 50th percentile levels for each environmental and public health stressor, relying on whichever is most protective (e.g., lower) in each instance.¹⁵¹

Other States have released mapping tools using similar methodologies. Washington uses a web-based mapping tool¹⁵² to inform environmental assessments of significant agency actions and to facilitate engagement with disadvantaged communities.¹⁵³ Illinois has used California’s methodology to identify “environmental justice communities” for the purpose of allocating solar

energy access.¹⁵⁴ Minnesota¹⁵⁵ and New Jersey¹⁵⁶ use mapping and screening tools to identify disadvantaged communities for permit application review purposes. Maryland has also released a screening tool to track disadvantaged communities and the distribution of environmental harms.¹⁵⁷ And additional states, including Michigan and Vermont, are in the process of developing mapping tools to inform state policies.¹⁵⁸ These tools enable states to identify existing and foreseeable disparities, and to direct attention and resources toward communities that are most susceptible to and impacted by environmental harms.¹⁵⁹

B. Cumulative Impacts in Environmental Siting and Permitting

Many of our States require private parties to produce cumulative impacts analyses when applying for a permit for a project or action that might impose disproportionate environmental impacts on a disadvantaged community. Those analyses must account for, among other things, environmental and public health stressors already borne by the affected community as a result of existing conditions and the potential of the proposed project or action to add to existing environmental and health burdens. By shedding light on environmental and health disparities, needs, and vulnerabilities, cumulative impacts analysis enables state agencies to prevent projects or actions that will exacerbate existing inequities, or ameliorate the harms thereof.

a. Permitting Processes

Several States, including California, Connecticut, and Montana, have long incorporated cumulative impacts analysis in their environmental review under mini-NEPA statutes.^{160,161} More recently, States have begun to require agencies to deny, or attach conditions to, applicable permits that are expected, based on cumulative impacts analysis, to exacerbate environmental and health inequities.¹⁶²

New Jersey’s environmental justice permitting regulations were finalized and adopted in 2023.¹⁶³ One of the three purposes for these regulations was to “limit the placement of new facilities that would create a disproportionate impact by causing or contributing to adverse cumulative stressors in an overburdened community.”¹⁶⁴ NJDEP defines “adverse cumulative stressors” as instances where the combined stressor total of the overburdened community is higher than the overburdened community’s geographic point of comparison or would be made higher than

¹⁶⁰ Cal. Pub. Res. Code §§ 21156; Conn. Gen. Stat. § 22a-1b(c) (requiring environmental impact evaluations to account for cumulative environmental effects); Haw. Code R. § 11-200.1-24(i), (l) (requiring environmental impact statement to examine cumulative impacts of proposed actions); Mont. Code Ann. § 75-1-208(11) (requiring agency, “when appropriate, [to] evaluate the cumulative impacts of a proposed project”); N.Y. Envir. Conser. Law § 8-0109.2(a)(k), 8-0109.4; *see also* N.J. Attachment to Exec. Order No. 215, *Guidelines for the Preparation of an Environmental Impact Statement / Environmental Assessment*, at 3 (requiring environmental assessments and impact statements to identify and describe the cumulative impacts of a proposed project); Wash. Rev. Code §§ 43.21C.405(3)(a), 43.21C.535(3)(a) (requiring certain agencies’ environmental impact statements to include analysis of cumulative impacts on “environmental justice and overburdened communities”); Ga. Code Ann. § 12-16-8(3) (advising that a government agency might prepare an environmental effects report on the basis that “the cumulative effect” of “a series of [proposed] governmental actions . . . is significantly adverse”).

¹⁶¹ “Mini-NEPA” statutes require government agencies to conduct environmental reviews of government or government-funded actions, similar to the environmental review processes required under NEPA. Dominique Rolle & William Snape, *Summary of the Current Issues on Environmental Justice and State “Mini-NEPAS,”* Environmental Justice State by State, <https://ejstatebystate.org/current-issues/mini-nepa>.

¹⁶² *See* N.J. Stat. Ann. §§ 13:1D-158 to 13:1D-160 (requiring a permit applicant to prepare an “environmental justice impact statement that assesses the potential environmental and public health stressors associated with the proposed new or expanded facility, . . . , and the environmental or public health stressors already borne by the overburdened community,” and requiring the Department of Environmental Protection to “deny a permit for a new facility upon a finding that approval . . . would . . . cause or contribute to adverse cumulative environmental or public health stressors in the overburdened community that are higher than those borne by other communities”); N.C. Gen. Stat. § 113A-120(a)(10) (requiring State body to deny an application for a permit upon certain findings about the proposed development’s contribution to cumulative effects, but limiting cumulative effects to “impacts attributable to the collective effects of a number of projects”); N.Y. Envir. Conser. Law § 70-118.2(b), 3(b) (requiring a permit applicant to prepare an “existing burden report,” and requiring the New York Department of Environmental Conservation to deny a permit for a new project “if it determines that the project will cause or contribute more than a de minimis amount of pollution to a disproportionate pollution burden on [a] disadvantaged community”); 2023 Minn. Laws ch. 60, art. 8, § 3, subd. 3, 5(b) (requiring a permit applicant when applicable to include cumulative impacts analysis with its application, and requiring the Minnesota Pollution Control Agency to enter into a community benefit agreement with, or “deny a permit . . . for[,] a facility in an environmental justice area if the cumulative impacts analysis determines that issuing the permit, in combination with the environmental stressors present in the . . . area . . . and considering the socioeconomic impact of the facility . . . , would have a substantial adverse impact on the environment or health of the . . . area and its residents”).

¹⁶³ N.J.A.C. 7:1C.

¹⁶⁴ N.J.A.C. 7:1C-1.3.

an overburdened community’s geographic point of comparison as a result of the facility’s contribution.¹⁶⁵ Where the overburdened community is subject to adverse cumulative stressors, the regulations require the applicant to include information in accordance with the Environmental Justice Impact Statement Requirements.¹⁶⁶

In another example, Massachusetts requires applicants seeking permits for facilities in or adjacent to environmental justice populations to submit a cumulative impact analysis as part of a Comprehensive Plan Application (CPA).¹⁶⁷ The CPA requires an assessment of existing community conditions based on evaluation of 33 environmental, health, and socio-economic indicators “including conditions and concerns raised by [environmental justice] populations[,]”¹⁶⁸ as well as air toxics risk characterization, air quality dispersion modeling, and an evaluation of “how air pollutant emissions could affect existing environmental and public health conditions.” and any proposed mitigation measures.¹⁶⁹ Under recently passed legislation, Massachusetts also now requires energy siting applications to include cumulative impacts analyses and requires the Energy Facilities Siting Board to consider those impacts as part of its decision-making process.¹⁷⁰

C. Distribution of Resources

Several states rely upon cumulative impacts analysis to distribute resources equitably to meet the needs of communities who bear disproportionate environmental and health burdens. Under Maryland law, the Commission on Environmental Justice and Sustainable Communities is charged with developing strategies to build climate equity and resilience in communities disproportionately affected by climate change.¹⁷¹ Vermont requires certain agencies to set goals around directing their investments that provide environmental benefits.¹⁷² California requires agencies to ensure that activities undertaken to comply with regulations setting greenhouse gas emissions limits and reduction measures do not disproportionately burden disadvantaged

¹⁷² See 3 V.S.A. § 6004(h).0

communities.¹⁷³ And Maryland and California both prioritize the allocation of climate change funds toward disproportionately affected communities.¹⁷⁴

D. Prioritization of Community Engagement

Finally, many of our States' environmental programs prioritize engagement with disadvantaged communities as a central component of identifying and understanding cumulative impacts.

As early as 2009, New Jersey Governor Corzine signed New Jersey Executive Order 131, promoting environmental quality in low-income and minority communities.¹⁷⁵ EO 131 states, among other things, “the cumulative exposure to pollution and other hazards from multiple sources in communities whose residents are predominantly low-income and persons of color creates a disproportionate impact on the health, well-being, and quality of life[.]”¹⁷⁶ EO 131 also acknowledges that addressing cumulative impacts “requires a coordinated response across multiple governmental agencies and a more inclusive process of decision-making.”¹⁷⁷ In 2021, the NJDEP Commissioner built on existing efforts by issuing Administrative Order 2021-25 requiring NJDEP to use “its existing legal authority to... ensure meaningful public engagement and the implementation of feasible conditions to avoid or reduce contributions to existing public health and environmental stressors in overburdened communities while rulemaking is ongoing.”¹⁷⁸ Permit applicants are required to “respond to and address the concerns raised by individuals in the overburdened community and to conduct any additional analysis related thereto that the Department deems necessary for its review.”¹⁷⁹

Many states require permit applicants to hold public hearings and engage in other forms of public involvement when their proposed facilities would be located in or have an impact on disadvantaged communities, where permitting involves a community benefits agreement,¹⁸⁰ or in developing zoning plans.¹⁸¹ States also require certain agencies to conduct public outreach, community listening sessions, and form commissions partly comprised of residents of

disadvantaged communities, to ensure that regulations and agency actions reflect the interests of those communities.¹⁸²

States continue to innovate in our efforts to meet the challenges posed by cumulative impacts on our residents and look to EPA as a partner in this work.

V. States Urge Federal Leadership on Cumulative Impacts.

While drafted “as resource for EPA staff and decision-makers,” the guidance and leadership offered by EPA’s *Framework*, along with other recent steps to bolster EPA’s implementation of cumulative impacts analysis, benefit our States and our stakeholders.^{183,184} Incorporating assessments of the cumulative impacts of environmental and climate burdens and benefits has become increasingly important to protecting the health, safety, and prosperity of our residents and to facilitating sound environmental and climate decision-making. Clear direction from EPA enables the agency to provide effective and efficient programs and services, enhance cross-agency collaboration, and respond with greater transparency and consistency to the needs of State, local, and Tribal governments, communities, and regulated entities.

A. States Support the Implementation of EPA’s *Framework*.

First, the States affirm the value of clear goals as EPA looks to cumulative impacts analysis to further its mission to work with state, local, and Tribal governments, communities, and regulated entities to protect human health and the environment for all. Even as our States adapt the cumulative impacts approach to address the distinct needs and circumstances of our constituents, we recognize the need for common goals and principles with which to implement assessment and consideration of cumulative impacts. To provide a “shared point of reference,” EPA outlines both long-term and immediate goals for “incorporating analysis and consideration of cumulative impacts into decisions.” The *Framework* defines EPA’s long-term goals as

¹⁸² See e.g. Md. Code Ann., Envir. § 1-701(c)(1), (g)(1), (h)(1) (establishing Commission on Environmental Justice and Sustainable Communities to advise Maryland agencies on environmental justice and other issues, requiring Commission to consist partly of residents of disadvantaged communities, and requiring Commission to host community listening sessions in disadvantaged communities); *id.* § 1-702(c)(1) (requiring Maryland Department of the Environment, in developing procedures for addressing climate impacts in disadvantaged communities, to “[s]olicit input from all segments of the population that will be impacted by th[ose] policies”); See 3 V.S.A. § 6004(c) (requiring certain Vermont agencies to create and adopt community engagement plans); *id.* § 6006(a), (d) (establishing in Vermont the Environmental Justice Advisory Council and Interagency Environmental Justice Committee “to provide independent advice and recommendations to State agencies and the General Assembly on matters relating to environmental justice,” and requiring Council membership to be comprised “with a goal to have more than 50 percent residing in environmental justice focus populations”).

¹⁸³ INTERIM FRAMEWORK, *supra* note 1, at 2.

¹⁸⁴ See e.g. EPA, *Legal Tools*, *supra* note 122; CUMULATIVE IMPACTS RESEARCH: RECOMMENDATIONS, *supra* note 5.

- 1) Achieving “safe, healthy, and thriving” communities[;]”
- 2) Protecting all people “from disproportionate and adverse environmental human health and environmental effects and hazards, including cumulative impacts of environmental and other burdens[;]” and
- 3) Ensuring that [n]o community bears a disproportionate share of adverse environmental and public health impacts[.]”¹⁸⁵

The long-term vision articulated in those long-term goals aligns with goals underlying the environmental, environmental justice, and climate laws and policies adopted by our States, many of which are referenced above.

In service of that vision, the *Framework* details a set of more immediate goals as “empowering the EPA to:

- 1) More fully and accurately characterize the realities communities face;
- 2) Pinpoint the levers of decision-making and identify opportunities for interventions that improve health and quality of life while advancing equity; and
- 3) Increase meaningful engagement, improve transparency, and center actions on improving health and environmental conditions in communities.”¹⁸⁶

Those goals, too, echo our efforts to hone the precision, efficacy, and accountability of our approaches to cumulative impacts. Roadmaps guiding our environmental decision-making must be clear and transparent for all stakeholders involved. And government actors must build necessary trust to make certain the lived experiences of those most impacted guide the decisions to ensure all have access to clean air, water, and soil, and a safe and healthy home.

Second, we applaud EPA’s guidance on methodology rooted in an emphasis on a “fit-for-purpose” approach to assessing and addressing cumulative impacts.¹⁸⁷ At the core of EPA’s *Framework* is a conceptual model to inform the Initiation, Scoping and Problem Formation, Assessment, and Informing Decisions stages of a cumulative impacts assessment.¹⁸⁸ At the initiation stage, EPA identifies the need to understand the triggers for the analysis, its feasibility, and the decision context, including the relevant jurisdictions, procedures, and decision-makers. EPA also emphasizes the NEJAC’s 2004 recommendation that development of “a common understanding” of the multiple stressors concerning a community assist with “building the confidence, trust, and capacity within the impacted community[.]”¹⁸⁹ EPA next outlines considerations at the scoping and problem formation stage, including methodology, data needs, decision alternatives, and processes for community engagement and broader public review, as well as clear identification, characterization, and prioritization of the issues of concern.

¹⁸⁵ INTERIM FRAMEWORK, *supra* note 1, at 10.

¹⁸⁶ *Id.* at 9-10.

¹⁸⁷ *Id.* at 11.

¹⁸⁸ *Id.* at 12-23.

¹⁸⁹ *Id.* at 11.

In conducting the assessment itself, EPA outlines a series of factors to consider including, but not limited to, the range of stressors, exposure pathways, and vulnerabilities, with priority given to stressors affecting people and the environment combined with analysis of the underlying distribution of environmental benefits and burdens, ecological and cultural context, and defined priorities.¹⁹⁰ The *Framework* emphasizes the relevance of Indigenous science and knowledge to the assessment, particularly in addressing the distinct exposure pathways facing Indigenous and Tribal Peoples.¹⁹¹ As well, the *Framework* notes a range of relevant data sources to understand intrinsic and extrinsic individual, community, population, and/or life stage group vulnerabilities and health effects into the analysis, including quantitative, semiquantitative, and qualitative data, as well as mixed-methods and community participatory approaches. Finally, and particularly crucial, are the questions EPA outlines to guide how a cumulative impacts approach can inform environmental decision-making.¹⁹²

At each of these stages, EPA appropriately identifies the need for a context-specific fit for purpose approach. As demonstrated by the typology of methods included within the *Framework*¹⁹³ and the background provided above, our States—along with local governments, the science community, and many NGOs—have developed tailored approaches to incorporating cumulative impacts analysis at all stages of environmental decision-making. In doing so, we have often sought models. The guidance offered by this conceptual model and the definition of key terms will facilitate effective and transparent policymaking and implementation in our States. Moreover, knowing the considerations EPA recommends raising at every stage of its own process will assist federal-state collaboration.

Third, we applaud the emphasis and clear guidance on meaningful community engagement, with an emphasis on lived experience. Our States are committed to meaningful engagement with the communities most impacted by environmental and climate burdens including through cumulative impacts policies, many of which, the *Framework* notes, were “developed through a process of shared leadership, codesign, and authentic engagement with communities.”¹⁹⁴ Incorporating lived experience is necessary to understanding cumulative impacts and ensure the accuracy and credibility of the analysis. Meaningful engagement is the heart of that process and must be “guided by integrity, inclusiveness, dialogue, influence, and accountability.”¹⁹⁵ A robust cumulative impacts analysis requires participation of those who can provide “local knowledge of health and existing conditions; identify areas of concern and issues of interest that might not be readily apparent to those outside the community; offer contextual/cultural perceptions and

¹⁹³ *Id.* at 24.

¹⁹⁴ *Id.* at 50.

¹⁹⁵ *Id.* at 14.

experiences; and assist in identifying and refining the scope of the assessment and its ultimate recommendations.”¹⁹⁶

The emphasis on a place-based approach to cumulative impacts analysis reflects a need to understand the realities of geographically defined communities but does not discount the relevance of geographically dispersed populations. The *Framework*’s recognition that cumulative impacts analysis also applies to the vulnerabilities experienced by individuals, population groups, and life stages expands the vision for meaningful engagement consistent with the fit for purpose approach.¹⁹⁷ Finally, as noted above, the *Framework* appropriately gives special consideration to engagement with Indigenous Peoples and Tribal nations, a necessity not simply due to relevant expertise and vulnerabilities, but the sovereign relationships at issue and the need for free, prior, and informed consent.

Finally, we support the *Framework*’s stated commitment to utilize cumulative impacts analysis to “improv[e] human health, quality of life, and the environment in all communities” and “[f]ocus[] on the disproportionate and adverse burden of cumulative impacts.”¹⁹⁸ As noted by the Union of Concerned Scientists in its recent guide to cumulative impacts,

“[c]umulative impacts and disproportionate impacts are different but related concepts. *Cumulative impacts* refers to the totality of stressors and burdens. *Disproportionate impacts* refers to the fact that some communities have greater stressors and burdens relative to others. Assessing cumulative impacts is one way to bring attention to and acknowledge the full magnitude of both types of inequality.”¹⁹⁹

The *Framework* underscores the links between compounding social, environmental, and climate stressors and significant—often dire—disparities in health and wellbeing linked to structural inequality. As the 2024 NEJAC report cautions, traditional risk assessment alone might be insufficiently protective of human health and unable account for “the physical, social and emotional burdens” experienced by disadvantaged communities or “disproportionate burdens between communities.”²⁰⁰ The *Framework* acknowledges the relationship between traditional risk assessment, cumulative risk assessment, and cumulative impacts analysis, with recognition that cumulative impacts analysis “can employ key components of traditional risk assessment” while taking into account “stressors that are not considered in the EPA’s traditional risk assessment paradigm.”²⁰¹ Our States are undertaking various measures to identify and alleviate these persistent

disparities, including using cumulative impacts analysis. We welcome the guidance and illustrative examples offered by the *Framework*.

B. States Urge Continued Innovation to Fully Integrate Cumulative Impacts Analysis Into Federal Decision-Making and Model For Our and Other States and Municipalities.

In its *Framework*, EPA has outlined a series of next steps, which our States support. We also urge EPA to build on this *Framework* to more completely fulfill the objectives that it has laid out, including supporting “cumulative impacts analysis and assessment becoming a standard business practice across its programs[.]”²⁰² Toward this end, we offer the following points for agency consideration:

Improve access to publicly available data and expand consideration of indicators and impacts. We emphasize the continued need to expand access to publicly available data, which is crucial to inform cumulative impacts analysis and to ensure that the tools necessary for implementation are broadly accessible. EPA should also provide guidance on and expand the range of impacts and indices considered in cumulative impacts analysis.²⁰³ The National Academy of Sciences, Engineering, and Medicine’s *Constructing Valid Geospatial Tools For Environmental Justice* report is particularly instructive.²⁰⁴ This report recommends the adoption of “systematic, transparent, and inclusive processes to identify and select indicators and datasets that consider technical criteria (validity, sensitivity, specificity, robustness, reproducibility, and scale) and practicality (measurability, availability, simplicity, affordability, credibility, and relevance)[,]” as well as to “[e]valuate measures in consultation with federal agencies, technical experts, and community partners.”²⁰⁵

Improve and adopt methods that facilitate consideration of lived experience and foster sustained community partnerships. To fulfill the goals of the *Framework*, the agency should heed the recommendations from the NEJAC to ensure that cumulative impacts analysis fully captures “experiential and community knowledge.”²⁰⁶ As a component of that effort, we recommend incorporating and making accessible data that enhance consideration of lived experience.²⁰⁷ As the *Framework* acknowledges, this requires consideration of quantitative,

²⁰² *Id.* at 28.

²⁰⁴ NAT’L ACADS., *supra* note 7, at 197.

²⁰⁵ *Id.* at 9.

²⁰⁶ NEJAC 2024, *supra* note 141, at 39.

²⁰⁷ “Both community measures of data and lived experiences improve the understanding of local impacts from polluting sources and are useful for informing policy improvements. Combining indicators of environmental, health, and social stressors is similar to combining temperature and humidity to create a “heat index” or the temperature and wind speed to create a “wind-chill” so that communities can gain a better understanding of the full impact of multiple factors.” UNION OF CONCERNED SCIENTISTS, *supra* note 3, at 12.

semiquantitative, and qualitative data, as well as mixed methods.²⁰⁸ Use of more granular units of analysis can also be particularly helpful to ensure that community-level and distributional impacts are not obscured.²⁰⁹ As noted by the NEJAC, EPA should “adopt methods to factor in qualitative data such as public testimony and lived experience, or community science with small numbers of participants, existing health conditions, and other data,” including those “often dismissed in traditional risk assessment.”²¹⁰ Moreover, across all applications of cumulative impacts analysis, accuracy, effectiveness, credibility, and trust require “[c]reating and sustain[ing] community partnerships that provide forums and opportunities to identify local environmental justice issues, identify the indicators and datasets for measuring them, and determine whether [the analysis] results reflect community lived experiences.”²¹¹

Continue to advance cumulative impacts in federal decision-making, providing models to inform federal and non-federal jurisdictions. Consistent with statutory mandates and longstanding EPA practices, the agency should continue to utilize cumulative impacts analysis to inform environmental decision-making across EPA’s programs. As both EPA and state efforts demonstrate, incorporation of cumulative impacts analysis results in more credible science- and data-driven decisions. EPA should continue to provide clarity and consistency regarding methodology and implementation, including where cumulative impacts analysis is mandated under federal law. This will help facilitate efficiency and certainty for state, local, and Tribal governments, communities, and regulated entities. As states adopt and refine laws and policies, EPA’s approach helps establish a floor from which states can build, identify opportunities for innovation, and determine the best approach for our respective jurisdictions.

Improve and standardize distributional analyses across the agency and advance models for using cumulative impacts assessment to reduce disproportionate burdens. Consistent with the recommendations of the NEJAC, EPA should take every opportunity to use cumulative impacts analysis to identify and reduce disproportionate exposures and impacts in overburdened communities and on vulnerable populations.²¹² Building on the principles outlined in the *Framework*, clear guidance is needed to ensure that agencies are conducting well-reasoned, informative distributional analyses in the implementation of a cumulative impacts approach to more fully identify and understand how and where exposures and impacts are felt—and for those analyses to inform decision-making across the agency. We recommend creating clear and consistent goals and developing consistent methodologies for how and when to incorporate

²¹¹ NAT’L ACADS., *supra* note 7, at 5 (“For community engagement to be meaningful, it will be collaborative and sustained, and allow communities to feel involved in governmental decisions with local implications.”).

²¹² *See generally* NEJAC 2024, *supra* note 141.

distributional analyses into the agency’s cumulative impacts approach. Finally, we recommend establishing clear protocols for factoring distributive consequences in environmental decision-making to address environmental, economic, and health burdens on disadvantaged communities and vulnerable populations.

VI. Conclusion

In conclusion, consideration of cumulative impacts is crucial for sound federal and state environmental and public health decision-making. The release of EPA’s *Framework* is a critical step in advancing consistent, accurate, fair, and transparent use of this approach—a benefit to State, local, and Tribal governments; communities; and regulated entities. We therefore urge EPA to keep the *Framework* in place and to continue to advance the cumulative impacts analysis approach, in service of a healthy environment—wherever people live, play, work, learn, grow, and worship.
